Hash Apart

A hashtag is a word or a phrase prefixed with the symbol #.It is a form of metadata tag. Short messages on microblogging social networking services such as Twitter, Tout, identi.ca, Tumblr, Instagram, Flickr or Google+ may be tagged by including one or more with multiple words concatenated, e.g.:

#Wikipedia is an #encyclopedia

Hashtags provide a means of grouping such messages, since one can search for the hashtag and get the set of messages that contain it.

At times hast tag could be a phrase and written by concatenating words in the phrase, e.g.

#CorruptionFreeIndia

Which has 3 words Corruption Free India. But hash tag #corruptionfreeindia is equivalent and can be used as well.

In this problem you need to extract individual words from a hash tag. i.e. Given hashtag #WhatanIdeaSirji, your function shall return:

What, an, Idea, Sir, ji these 5 words.
